

What is claimed is:

1. A method of sealing a gasketed joint comprising:
 - (a) disposing a first gasket on a surface of a first member to be sealed;
 - (b) disposing a second gasket on said surface adjacent an edge of said first gasket;
 - (c) forming a pocket between an edge of said second gasket and said edge of said first gasket;
 - (d) disposing a measured amount of curable sealant in said pocket;
 - (e) disposing a surface of a second member to be sealed over said first and second gasket and compressing said gaskets and dispersing said sealant and filling said pocket; and,
 - (f) curing said sealant.
2. The method defined in claim 1, wherein said step of disposing a measured amount of sealant includes disposing a pellet of uncured elastomer.
3. The method defined in claim 1, wherein said step of disposing includes applying said sealant in semi-liquid form.
4. The method defined in claim 1, wherein said step of disposing curable sealant includes disposing a silicone gel.
5. The method defined in claim 1, wherein said step of curing said sealant includes one of (i) ambient temperature curing, (ii) elevated temperature curing (iii) irradiating.
6. The method defined in claim 1, wherein said step of forming a pocket includes forming a "V" shaped cavity.

7. The method defined in claim 6, wherein said step of dispersing includes flowing sealant into narrow side channels of said "V" shape.
8. The method defined in claim 1, wherein said step of disposing a first and second gasket includes disposing a gasket of material significantly stiffer in compression than said cured sealant.
